MEROMYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (HMM). IT CAN BE FURTHER SPLIT INTO 2 GLOBULAR SUBFRAGMENTS (SI) AND 1 ROD-SHAPED

SUBFRAGMENT (S2).

CORTES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CARRACTERISTIC FOR ALPHA-HELICAL COILED COILS.

CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.

THE ACTIN-ACTIVATED ATPASE ACTIVITY.

MISCELLANBOOMS. DICTYOSTELIUM MYOSIN II HAS NO K(2)EDTA ATPASE ACTIVITY, PERHAPS CORRELATED WITH THE ABSENCE OF A CYS AT THE SH-1 POSITION (689).

CIPTIN PAINS BY COMPREATED WITH THE ABSENCE S NONMUSCLE SIMILARITY HITH THE GLOBULAR HEAD SEQUENCE SOWNERVED, BUTTHE PERIODICITIES OF HYDROPHOSIC & CHARGED RESIDUES, WHICH DICTATE THE PERIODICITIES OF HYDROPHOSIC & CHARGED RESIDUES, WHICH DICTATE THE PERIODICITIES OF HYDROPHOSIC & CHARGED RESIDUES, WHICH DICTATE THE PERIODICITIES OF HYDROPHOSIC & CHARGED RESIDUES, WHICH DICTATE THE ALPHA-HELICAL COILED-COIL STRUCTURE, ARE CONSERVED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. COMPOSED OF VARYING SIZED, DISULFIDE-LINKED MULTIMERS, THE SMALLEST OF WHICH IS A HOMOTRIMER. PROTECLYSIS OF THE PROMULTIMERIN IN THE N-TERMINAL REGION, LEADS TO THE MATURE PISS FORM THAT IS STORED IN PLATELETS.

TISSUE SPECIFICITY: SYNTHESIZED BY ENDOTHELIAL CELLS AND MEGARARYOCYTES. STORED IN PLATELET ALPHA GRANULES AND ENDOTHELIAL CELL WEIBBL-PALADE BODIES, FOLLOWING ACTIVATION OF THESE CELLS, IT IS RELEASED AND ATTACHED TO MEGARARYOCYTES, PLATELETS, ENDOTHELIUM AND SUBENDOTHELLUM OF BLOOD VESSELS. NOT FOUND IN PLASMA FORIND IN

R. Tolle, R.; Bujard, H.; Cooper, J.A.
submitted to the EMMB. Data Library, July 1994
A. Description: Plasmodium falciparum: recombination within the C-terminal region
A. Reference number: S47282
A. Molecule type: DNA
A. Residues: 1-651 < TOL>
A. Reperimental source: strain R0-71
C. Superfamily: major merozoite surface antigen
C. Keywords: glycoprotein; merozoite; surface antigen

                     The sequence encoding the P195 protein of Plasmodium falciparum (AANSO530) and a peptide comprising at least one of its epitopes see AARSO777) are claimed. Also claimed is a vaccine for inducing immunity to malaria comprising the novel peptide or P195 or a peptide comprising at least one epitope when derived from the new DNA sequence, together with a carrier.

                                                                                                                                                                                                                                                                  (merozoite surface) protein. The gene encoding this protein has been stabilised by reducing the AT content of the nucleotide sequence. Such a protein is useful in vaccines against malaria or for producing monoclonal antibodies (for passive immunisation). The complete gp190 protein can now be produced outside the parasite and has, at least over extended regions, the native pattern of folding. Larger amounts of the protein can be produced recombinantly than would be possible using the parasites as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NFKNVLESDLIPYKDLTSSNYVVKDPYKFLNKEKRDKFLSSYNYIKDSIDTDINFANDVL 120

Plasmodium falciperum. The nucleir acid sequence encoding MSP-1-42 has been modified (see AAX2586) compered to the native sequence (see AAX25587) such that 306 nucleotide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell culture and in transgenic mice. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New modified recombinant nucleic acid sequences useful for producing malarial DNA vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                provides modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that are difficult to express in cell culture systems, mammalian cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a 42 kDa C-terminal portion malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;
                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a 42 kDa C-terminal portion of malaria merzoite surface protein MSP-1 (i.e. MSP-1-42), an malaria merzoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The nucleic acid sequence encoding MSP-1-42 has been modified (see AAX56008) compared to the native sequence (see AAX56009) such that 306 nucleotide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell culture and in fransgenic mice. Native MSP-1-12 is known to be difficult to express in cell culture systems, mammalian cell culture systems or in transgenic animals. The characteric in the milk of transgenic animals, and also provides a DNA vaccine comprising a

                                                      This present sequence comprises a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. A nucleic acid (see AAX56008) encoding MSP-1-2 has been modified according to a method of the invention in order to improve expression in mammalian cells and in transgenic animals by reducing the AT content and removing mRNA instability motifs. The invention allows expression of MSP-1-42 in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 nucleic

This present sequence comprises a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vacche against plasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. Nucleic acids (see AAX25586 and AAX25593) encoding MSP-1-42 have been modified according to a method of the invention in order to improve expression in mammalian cells and in transgent animals. The invention provides modified recombinant nucleic acid sequences and methods for increasing the recombinant nucleic acid sequences and methods for increasing the recombinant nucleic acid sequences and methods for increasing the company of protein expression of protein expression are those derived from lower culture systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower conganisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               producing

                                                                                                                                                                                                                    to be used. The invention allows expression of MSP-1 in the milk of transgenic animals, and also provides a DNA vaccine comprising vector containing the altered MSP-1-42 nucleic acid.

                                                                                                                                                                                                                    The present sequence represents a 42 kDa C-terminal portion of manaria merozoite surface protein MSP-1 (1.e. MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The sequence has been modified to include an N-terminal beta-casein signal peptide and an N-terminal oxHis and N262, mutations have been introduced eliminate 2 N-01ycosylation sites. These modifications allow the MSP-1-42 protein to be expressed in the milk of transgenic mice.

The present sequence represents a 42 kDa C-terminal portion of malaria mercozite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The sequence has been modified to include plasmodium falciparum. The sequence has been modified to include an N-terminal beta-casein signal peptide and an N-terminal 6xHis tag. In addition, N1810 and N2620 mutations have been introduced to eliminate 2 N-glycosylation sites. These modifications allow the MSP-1-42 protein to be expressed in the milk of transgenic mice. The invention generally relates to modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and cell culture systems, ammanian cell culture systems or in transgenic animals. The preferred difficult protein candidates for transgenic animals. The preferred difficult protein candidates for transgenic animals. The preferred difficult protein candidates conspicult and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used.
                                                                                                                                                                                                                                                                                                                                                                      recombinant nucleic acid sequences useful for producing vaccine

fragment of a Plasmodium merosotic surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of blasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of plasmodium MSP-1_4_2, and proteolytic cleavage of plasmodium present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-133 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to non-natural variants of a C-terminal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 kD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                /note= "amino acids derived from P. falciparum MSP1 p19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           272 KTMIQQSSGCFRHLDEREECKCLLNYKQEGDKCVENPNPTCNENNGGCDADAKCTEEDSG 331

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 kD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.

The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The mon-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteclytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteclytic cleavage of Plasmodium MSP-1_4_2. The non-natural variants of the present invention are useful for immunishing a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-119 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               272 KTMIQQSSGCFRHLDEREECKCLLNYKQEGDKCVENPNPTCNENNGGCDADAKCTEEDSG 331

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the amino acid sequence of a chimeric protein comprising amino acids 1-32 of the Plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Asn1613-Ser1705 which correspond to the 19 KD C-terminal fragment (P19) of MSP-1 from Plasmodium falciparum. P19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the P19 fragment provides a high level of protective immunity since it includes epitopes not presented in the P42 fragment.

The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                       /note= "encoded by restriction enzyme sequence used to
   create the chimeric sequence"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the amino acid sequence of a chimeric protein comprising amino

                      The sequence encoding the P195 protein of Plasmodium falciparum (AAN50530) and a peptide comprising at least one of its epitopes (see AAP50777) are claimed. Also claimed is a vaccine for inducing immunity to malaria comprising the novel peptide or P195 or a peptide comprising at least one epitope when derived from the new DNA sequence, together with a carrier.

This sequence represents a modified Plasmodium falciparum gp190/MSP-1 (merozolite surface) protein. The gene encoding this protein has been stabilised by reducing the AT content of the nucleotide sequence. Such a protein is useful in vaccines against malaria or for producing monoclonal antibodies (for passive immunisation). The complete gp190 protein can now the produced outside the parasite amounts of the protein can be produced setting than would be possible using the parasites as

                                                                                                                                                                                                                                                                                                 The present sequence represents a 42 kba C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The nucleic acid sequence encoding MSP-1-42 has been modified (see AAX56008) compared to the native sequence (see AAX56009) such that 306 nucleotide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell culture and in transgenic mice. Native MSP-1-12 is known to be difficult to express in cell culture systems.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mammalian cell culture systems or in transgenic animals. The invention allows expression of MSP-1 protein in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 1665.5; DB 20; Length 355;

The present sequence represents a 42 kba C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against propertial target for the development of a vaccine against propertial target for the development of a vaccine against the placed to plasmodium falciparum. The nucleic acid sequence encoding MSP-1-42 has been modified (see AAX5586) compared to the native sequence (see AAX5587) such that 306 nucleotide positions have been replaced to lower the AT content (from for 0.7%) and to eliminate 10 mRNA instability motifs while maintaining the same protein amino acid sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell culture and in transgenic mice. The invention provides modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that increasing the mRNA levels and protein expression of protein cell culture systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used. The invention allows expression of MSP-1 protein in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 NFKNVLESDLIPYKDLTSSNYVVKDPYKFLNKEKRDKFLSSYNYIKDSIDTDINFANDVL 120

This present sequence comprises a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against blasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. A nucleic acid (see AAX56008) encoding MSP-1-2 has been modified according to a method of the invention in order to improve expression in mammalian cells and in transgenic animals by reducing the AT content and removing mRNA instability motifs. The invention allows expression of MSP-1-42 in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 nucleic

This present sequence comprises a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. Nucleic acids (see AAX25586 and AAX25593) encoding MSP-1-42 have been modified according to a method of the invention in order to improve expression in mammalian cells and in transgenic animals. The invention provides modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             modified recombinant nucleic acid sequences useful for producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           recombinant nucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that are difficult to express in cell culture systems. especially mammalian cell culture systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower organisms such as parasites, bacteria and viruses that have DNA coding sequences of high Ar content or which have mRNA instability motifs or rare codons relative to the recombinant expression system

                                                                                                                                                                                                                        to be used. The invention allows expression of MSP-1 in the milk of transgenic animals, and also provides a DNA vaccine comprising vector containing the altered MSP-1-42 nucleic acid.

                                                                                                                                ಭ
                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a 42 kba C-terminal portion of manalaria marozoite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The sequence has been modified to include an N-terminal beta-casein signal peptide and an N-terminal faxHis and intending on N181Q and N262Q mutations have been introduced eliminate 2 N-91ycosylation sittes. These modifications allow the MSP-1-42 protein to be expressed in the milk of transgenic mice.

The sequence has been modified to include no N-terminal beta-casein signal peptide and an N-terminal 6xHis tag. In addition, N1810 and N2620 mutations have been introduced to eliminate 2 N-glycosylation sites. These modifications allow the MSP-1-42 protein to be expressed in the milk of transgenic mice. The invention generally relates to modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that are difficult to express in call culture systems. The preferred difficult protein candidates for transgenic animals. The preferred difficult protein candidates for transgenic animals. The preferred difficult protein candidates for expression are those derived from lower organisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NFKNVLESDLIPYKDLTSSNYVVKDPYKFLNKEKRDKFLSSYNYIKDSIDTDINFANDVL 120

The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of plasmodium MSP-1_4_2, and has the non-natural variants of the present invention are useful for immunising a mammal against malaria, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               can be used to treat malaria. The present sequence is MSP-133 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 NFKNVLESDLIPYKDLTSSNYVVKDPYKFLNKEKRDKFLSSYNYIKDSIDTDINFANDVL 120

The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                        /note= "amino acids derived from P. falciparum MSPl p19

The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.

The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of plasmodium MSP-1_4_2, and has the non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-119 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            270 KTMIQQNSGCFRHLDEREECKCLLNYKQEGSKCVENPNPTCNENNGGCDADAKCTEEDSG 329

                                                                                                                                                                                                                                                                                                                                                                                                                                                               1;
                                                                                                                                                                                                                                                                                                                           This is the amino acid sequence of a chimeric protein comprising amino acids 1-32 of the plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Asn1613-Ser1705 which correspond to the 19 kD C-terminal fragment (p19) of MSP-1 from Plasmodium falciparum. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.

The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective
                                                                                                                                                                                                                                                 ಭ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunity since it includes epitopes not presented in the p42 fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      245 KSILSNLLDWKLARYVKHPTTPMRKKTMIQQNSGCFRHLDEREECKCLLNYKQEGSKCVE 304

                                                                                                                                                                                                                                                                                                                                                                 MULTIMERS. THE SMALLEST OF WHICH IS A HOWOTRIMER. PROTECLINKED MULTIMERS.

THE PROMULTIMERS THE SMALLEST OF WHICH IS A HOWOTRIMER. PROTECLISIS OF THE PROMULTIMERIN IN THE N-TEMBINAL REGION, LEADS TO THE MATURE PLISS FORM THAT IS STORED IN PLATELETS.

TISSUE SPECIFICITY: SYMTHESIZED BY ENDOTHELIAL CELLS AND MEGAKARYOCYTES. STORED IN PLATELET ALPHA GRAULLES AND ENDOTHELIAL CELL WRIBEL-PALADE BODIES, FOLLOWING ACTIVATION OF THESE CELLS, IT IS RELEASED AND ATTACHED TO MEGAKARYOCYTES, PLATELETS, ENDOTHELIUM AND SUBRUDOTHELIUM OF BLOOD VESSELS. NOT FOUND IN PLASMA. FOUND IN PLASUES SUCH AS PLACEMTA, LUNG, AND LIVER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PTM: EXTENSIVELY N-GLYCOSYLATED.

DISEASE: DEFICIENCY IN MULTIMERIN DUE TO PROTEOLYTIC DEGRADATION
MITHIN THE PLATELET ALPHA GRANULES IS ASSOCIATED WITH AN AUTOSOMAL.

DOMINANT BLEEDING DISORDER (FACTOR V QUEBEC).

SIMILARITY: CONTAINS 1 GIQ DOMAIN.
SIMILARITY: CONTAINS 1 EGF-LIKE DOMAIN.
